Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method, comprising:

initializing a virus scanner during a pre-boot phase of a computer system from firmware that is embedded within the computer system:

scrubbing data read from an input/output (I/O) device of the computer system by the virus scanner using a virus signature database before the data is loaded, wherein the virus signature database is stored in a place not exposed to the operating system and is updated during the pre-boot phase; and

enacting a platform policy if a virus is detected in the data.

- (Original) The method of claim 1, further comprising scrubbing contents
 of a memory device of the computer system during the pre-boot phase by the virus
 scanner.
- (Original) The method of claim 1, further comprising updating the virus signature database with updated virus signatures.
- (Original) The method of claim 3 wherein the virus signature database is updated during the pre-boot phase.

Application No. 10/811,719 Atty. Docket No. 42P18654
Amendment dated December 2, 2008 Examiner HOANG, Daniel L.
Response to Office Action of October 6, 2008 TC/ALU, 250

(Original) The method of claim 1 wherein the virus signature database is

not exposed to an operating system executing on the computer system.

6. (Original) The method of claim 5 wherein the virus signature database is

stored in a firmware-reserved area.

5.

7. (Previously Presented) The method of claim 1 wherein the virus scanner

is executing in a virtual machine monitor (VMM) executing on the computer system, the

VMM supporting at least one virtual machine (VM) executing on the computer system,

wherein the VM executes an operating system that is different from the VMM and the

operating systems executed by other VMs.

8. (Original) The method of claim 7 wherein scrubbing data read from the

I/O device includes:

receiving a request from a requester to read data from the I/O device, the

requester in a VM of the at least one VM;

loading at least a portion of the requested data into a buffer;

scrubbing the at least a portion of the requested data with the virus scanner,

returning an error signal to the requester if the virus scanner detects a virus in the

at least a portion of the requested data; and forwarding the requested data to the requester

if the virus scanner does not detect a virus in the at least a portion of the requested data.

-3-

9. (Original) The method of claim 1 wherein the virus scanner is operable during the pre-boot phase, an operating system (OS) runtime phase, and an after-life phase of the computer system independent of an operating system of the computer

system.

- (Original) The method of claim 1 wherein the virus scanner scrubs the data without having knowledge of a file system of the data.
- (Original) The method of claim 1, further comprising enacting the platform policy if the virus scanner detects non-normal behavior within the computer system.
- 12. (Currently Amended) An article of manufacture comprising: a machine-accessible medium including a plurality of instructions which when executed perform operations comprising:

initializing a virus scanner during a pre-boot phase of a computer system; scrubbing contents of a memory device of the computer system during the pre-boot phase by the virus scanner using a virus signature database <u>from firmware that is embedded</u> within the computer system;

scrubbing data read from an input/output (I/O) device of the computer system by the virus scanner using the virus signature database before the data is loaded, wherein the virus signature database is stored in place not exposed to the operating system and is updated during the pre-boot phase; and generating an error signal if a virus is detected by the virus scanner.

13. (Original) The article of manufacture of claim 12, further comprising receiving undated virus signatures at the computer system to undate the virus signature database.

- (Original) The article of manufacture of claim 12 wherein the virus 14. signature database is stored in a place not exposed to an operating system of the computer system.
- 15. (Original) The article of manufacture of claim 12 wherein the virus scanner to be operable during the pre-boot phase, an operating system (OS) runtime phase, and an after-life phase of the computer system independent of an operating system of the computer system.
- 16. (Original) The article of manufacture of claim 12 wherein the virus scanner to scrub the data without having knowledge of a file system of the data.
- (Original) The article of manufacture of claim 12 wherein scrubbing data 17. read from the I/O device includes:

launching a virtual machine monitor (VMM), the virus scanner to operate from the VMM; and

launching a virtual machine (VM) to be supported by the VMM.

18. (Original) The article of manufacture of claim 17 wherein execution of the plurality of instructions further perform operations comprising:

receiving a request from a requester in the VM to read data from the I/O device; loading at least a portion of the requested data into a buffer;

scrubbing the at least a portion of the requested data with the virus scanner;

returning an error signal to the requester if the virus scanner detects a virus in the at least a portion of the requested data; and

forwarding the requested data to the requester if the virus scanner does not detect a virus in the at least a portion of the requested data.

- (Previously Presented) The article of manufacture of claim 12 wherein the plurality of instructions is to operate in compliance with an Extensible Firmware Interface (EFI) specification.
 - 20. (Currently Amended) A computer system, comprising:
 - a processor;
 - a memory device operatively coupled to the processor;
 - a storage device operatively coupled to the processor, and
- at least one flash memory device operatively coupled to the processor, the at least one flash memory device including firmware instructions which when executed by the processor perform operations comprising:

Application No. 10/811.719 Atty, Docket No. 42P18654 Amendment dated December 2, 2008 Examiner HOANG, Daniel L. TC/A.U. 2436

Response to Office Action of October 6, 2008

initializing a virus scanner during a pre-boot phase of a computer system from the firmware;

scrubbing contents of the memory device during the pre-boot phase by the

virus scanner using a virus signature database, wherein the virus signature

database is stored in a place not exposed to the operating system and is updated

during the pre-boot phase;

scrubbing data read from the storage device by the virus scanner using the

virus signature database before the data is loaded in the memory device; and

generating an error signal if a virus is detected by the virus scanner.

2.1 (Original) The computer system of claim 20, further comprising a

network interface operatively coupled to the processor, the virus scanner to scrub data

read from the network interface using the virus signature database before the data is

loaded in the memory device.

22 (Original) The computer system of claim 20 wherein the virus signature

database is stored in a firmware reserved area of the storage device, the firmware

reserved area not exposed to an operating system of the computer system.

23. (Original) The system of claim 20 wherein execution of the firmware

instructions further perform operations comprising updating the virus signature database

with updated virus signatures downloaded from an external virus signature repository

communicatively coupled to the computer system.

-7-

Application No. 10/811,719

Atty. Docket No. 42P18654

Amendment dated December 2, 2008

Examiner HOANG, Daniel L.

Response to Office Action of October 6, 2008 TC/A.U. 2436

(Original) The computer system of claim 20 wherein the virus scanner is

operable during the pre-boot phase, an operating system (OS) runtime phase, and an

after-life phase of the computer system independent of an operating system of the

computer system.

24.

25. (Original) The computer system of claim 20 wherein the virus scanner to

scrub the data without having knowledge of a file system of the storage device.

26. (Previously Presented) The computer system of claim 20 wherein the

firmware instructions to operate in compliance with an Extensible Firmware Interface

(EFI) specification.

27-30. (Canceled)
